Operator · 3 分钟演示稿（简单版）

短句，简单词。英文照着念，括号里是动作。全部念完约 2 分 50 秒。

0:00–0:20 开场（主页）

> Hi, I'm Lee. This is Operator.
>
> Last month I got a zero on a homework. I did not see it. It was hidden in Brightspace, with 90 other things. Brightspace is where all our classes post homework.
>
> Operator watches Brightspace for me. It only tells me the things that matter.

0:20–0:40 过滤（「没打扰你的」卡片）

> Every 10 minutes it reads my Brightspace calendar. Then it sorts every item: urgent, good to know, or ignore.
>
> My feed has 94 items. 83 are ignored. It shows me why.

（点开「Old course」，滚一下，再点「Already past」）

0:40–1:00 Agent 记录（往下滚到「What the agent did」）

> Everything it does is written here. When it checked Brightspace. When it sent me a message. When I told it something.
>
> No black box. I can always see what it did and why.

1:00–1:35 手机（举起手机）

> The same agent lives on my phone, in iMessage.

（展示手机上的对话）

> It sends me short messages when something changes, and reminds me before every deadline. And I can talk to it right here. Watch.

（手机发语音：「我刚交了 EST 393 的 HW#3」→ 等回复 → 切回网页，HW#3 打勾）

> I just said "I finished HW#3". It found the right homework, marked it done, and the reminders stopped. If it is not sure what I mean, it asks me first.

1:35–2:10 网页对话（点右下 Agent → Voice call）

> The same brain is on the website. I can talk to it.

（说："What do I have on Tuesday?" → 等它读完，字幕一个词一个词亮）

> It answers out loud, with live subtitles.
>
> I can also just tell it things, in English or Chinese.

（挂断，在输入框打字："Meeting with Prof. Lee Friday 2pm at Harriman 212" → 回车 → 会议出现在周五下午 → 点 Undo）

> One sentence, one meeting added. One click to undo.

2:10–2:35 早报、本周、截止、课程

（点顶部 Morning telegram，听 5 秒，按停）

> Every morning it reads me my day.

（切 Week 页）

> This is my week. Classes, meetings, events, deadlines, all in one place.

（切 Deadlines 页，再切 Courses 页，各停一秒）

> Every deadline, by month. And every class, with what is due for it.

2:35–2:50 皮肤和语言，收尾

（点右上调色盘，选「Steam · Airship」→ 点「中」再切回 EN）

> Five looks. English or Chinese. Nothing to set up.
>
> Operator is live at myoperator.club. The code is on GitHub. We used Gemini, Photon for iMessage, ElevenLabs for voice, a GoDaddy domain, and Vultr.
>
> Less noise, only what matters. I have not opened Brightspace in two days. Thank you.

演示前 10 分钟

- 手机给 +1 415 605-6081 发一句 hi，预热 iMessage 线路。
- Chrome 开两个标签：主页、GitHub。麦克风权限允许。音量开大。
- 开场用「简洁」皮肤，最后再切到蒸汽皮肤，对比更明显。
- HW#3 是未完成（现在全部作业都是未完成）。

出问题怎么办

- 早报是提前做好的，一定能放。
- 手机 30 秒没回：给评委看之前收到的消息截图，继续讲。
- Gemini 报忙：跳过网页提问，直接演示周视图、截止、课程、皮肤。

评委可能问（简单英语，背熟）

1. How do you decide what is urgent?

> Eight simple rules, in order. Exams are always urgent. Anything due within 72 hours is urgent. A quiz within a week is urgent. Old classes, past items, "module available" notices and school notices are ignored. Everything else is "good to know". No black box, I can show every rule in the code.

2. What if it ignores something important?

> It never deletes anything. The dashboard shows every ignored item and the reason, and Brightspace is still there. The agent reduces noise, it does not hide your data.

3. How is this different from Canvas or Google Calendar reminders?

> They remind you about everything. Operator filters first, explains what it filtered, and you can talk back by text, voice or photo.

4. Where does the data come from? Do you need my password?

> No password. Brightspace gives every student a private calendar link. We only read that link. Nothing is scraped, nothing is logged in.

5. How can another student use it?

> Paste your own Brightspace calendar link on the Setup page. That is the whole setup. Login with SBU email for many users is the next step.

6. What does Gemini do exactly?

> It understands what you send: text, a voice note, a photo of a timetable. It decides what you mean: done, undo, question, add, or just chat. It answers questions about your schedule, and it writes the daily briefing. The urgency rules themselves are not AI, so they are predictable.

7. What happens if Gemini is wrong?

> Two safety rules. It only acts when it is confident; otherwise it asks you which item you meant. And every action is logged and can be undone in one click.

8. Why iMessage and not an app or email?

> Students read iMessage. Nobody opens another app. Photon gave us two-way iMessage in a few lines of code.

9. What did ElevenLabs add?

> The briefing and answers are spoken. ElevenLabs gives us word timestamps, so the subtitles light up as it speaks. You can also just talk to it, hands free.

10. What was the hardest part?

> Trust. Gemini once invented a transcript for audio it could not decode and marked a homework done. Now we convert all audio first and tell the model never to guess. Also timezones: the server was in UTC and sent a wrong "deadline moved" message.

11. Is it running right now? How is it hosted?

> Yes, live at myoperator.club on a Vultr server, HTTPS, checking my real Brightspace every ten minutes. The code is public on GitHub, with tests for the rules.

12. What would you do with more time?

> Login for many users, Gemini explaining its reasoning inside the message, and reading instructor announcements from Brightspace emails, which the calendar feed does not include.

13. How does this fit "Steel and Steam"?

> The telegraph operator. In the steam age, one person listened to every line and only ran to find you when a wire mattered. That is exactly what this agent does. The steam skin is the visual nod.

14. Did you use AI to build it?

> Yes, we used Claude for coding and Gemini inside the product. The design decisions, the rules, and the testing on real data are ours.

答不上来时

> Good question. We did not get to that this weekend, but here is how I would do it: ...
